

EXPERIMENT 3

Application Building using Zia Assistant

1. Aim

To study the use of the Zia Assistant in Zoho Creator for building an application with natural-language assistance, generating application components, and simplifying the development process with minimal manual coding.

2. Introduction

Zia is an Artificial Intelligence assistant integrated with Zoho applications. It can assist users in creating application components, understanding requirements, working with data, and performing development-related tasks through natural-language instructions. The approach can reduce repetitive configuration work and help users create application features more quickly.

2.1 Zia Assistant

The Zia Assistant allows a user to describe an application requirement in simple language. Based on the supported features, it can help create or configure forms, fields, reports, and other application elements. The user can then review and modify the generated components.

3. Objectives of the Study

- To understand how Zia Assistant supports low-code application development.
- To create an application from a practical requirement using AI assistance.
- To identify suitable forms and fields for the selected application.
- To examine how Zia can reduce repetitive application-building tasks.
- To test and refine the application after AI-assisted creation.

4. Application Selected: Library Book Management System

A Library Book Management System is selected instead of the Student Management application used in the reference assignment. The application is intended to maintain book information, member details, issue records, and return status.

5. Procedure

1. Log in to Zoho Creator and open the application-building environment.
2. Start a new application and open the Zia Assistant.
3. Enter a natural-language requirement describing a Library Book Management System.
4. Ask Zia to create suitable forms for Books, Members, and Book Transactions.
5. Review the fields suggested or generated by the assistant.
6. Add or modify fields such as Book ID, Title, Author, Category, Member ID, Issue Date, Due Date, and Return Status.
7. Create reports to view available books and active issue transactions.
8. Add validation rules where required, such as mandatory book and member details.
9. Test the forms by entering sample library records.
10. Review the application and publish it after confirming that the required components work correctly.

6. Sample Zia Prompt

Prompt: Create a Library Book Management application with forms for Books, Members, and Issue/Return Transactions. Include fields for book details, member details, issue date, due date, return status, and generate reports for available and issued books.

7. Application Components

Component	Purpose
Book Form	Stores book ID, title, author, category and availability.
Member Form	Maintains member ID, name, contact and membership details.
Transaction Form	Records issue date, due date, return date and status.
Book Report	Displays books and their current availability.
Issue Report	Shows books currently issued and pending returns.

8. Detailed Analysis

The Library Book Management System demonstrates how an AI-assisted low-code workflow can begin from a plain-language requirement. Instead of manually creating every component from the beginning, the developer can use Zia Assistant to generate or suggest application elements and then adjust them according to the actual requirement. Human review remains necessary to verify field names, relationships, validation, and application behavior.

9. Testing and Verification

- Enter a new book and verify that it appears in the Book Report.
- Register a library member and confirm that the member information is stored.
- Create an issue transaction and check the due date and return status.
- Change the return status and verify the corresponding report.
- Check that mandatory fields prevent incomplete records.

10. Advantages

- Natural-language interaction makes application creation easier to understand.
- Reduces repetitive configuration and manual development work.
- Helps users create application components more quickly.
- Supports rapid prototyping of business applications.
- Generated components can be reviewed and customized by the developer.

11. Limitations

- AI-generated components still require user verification and modification.
- Available Zia capabilities depend on the platform and enabled features.
- Complex application requirements may need additional manual configuration or scripting.

12. Result

The experiment was successfully completed by studying application building with Zia Assistant in Zoho Creator. A Library Book Management System was selected as the practical application, demonstrating how natural-language requirements can be used to assist in creating forms, reports, and related application components with reduced manual coding.

13. Conclusion

Zia Assistant provides an AI-supported approach to low-code application development. The Library Book Management example shows how the assistant can help transform a functional requirement into an initial application structure, after which the developer can validate, customize, test, and publish the final application.

Illustrative Application Layout

Library Book Management System

MODULE	EXAMPLE FIELDS / INFORMATION
Books	Book ID Title Author Category Availability
Members	Member ID Name Department Phone Membership Status
Issue / Return	Transaction ID Book Member Issue Date Due Date Return Date Status
Reports	Available Books Issued Books Overdue Returns Member Transactions

The layout above represents the proposed application structure for the selected Library Management use case.
