

## Ex. No: 5 — Dashboard

### Low Code Application Development

---

#### Aim

To design and build an interactive Dashboard for a business application using the Zoho Creator low-code platform, and to visualize key business metrics through widgets such as KPI cards, charts, and list views.

#### Software Used

Zoho Creator (Low Code Application Development Platform)

#### Description

A Dashboard in a low-code platform such as Zoho Creator is a visual summary page that pulls live data from an application's forms and reports and presents it through widgets like KPI cards, bar charts, pie charts, and list/table views. Dashboards allow decision makers to monitor key metrics at a glance without writing custom front-end code, since Zoho Creator provides a drag-and-drop Dashboard Builder for arranging these widgets on a canvas.

#### Procedure

- 1 Log in to Zoho Creator and open (or create) the application, e.g. **Sales Insights App**.
- 2 Create the underlying Forms and Reports that will supply data to the dashboard (for example, a *Deals* form with fields for Deal Name, Owner, Stage, and Amount).
- 3 Navigate to the **Dashboards** section from the left sidebar and click **Add Dashboard**.
- 4 Give the dashboard a name, e.g. *Sales Overview Dashboard*, and open the Dashboard Builder canvas.
- 5 Drag and drop widgets onto the canvas: KPI/metric cards for totals (Total Revenue, New Leads, Deals Closed), a Bar Chart widget for monthly sales trends, a Pie Chart widget for regional split, and a List widget for recent deal records.
- 6 For each widget, configure its data source by selecting the relevant report/field and the aggregation type (Sum, Count, Average, etc.).
- 7 Arrange and resize the widgets on the canvas for a clean, readable layout.
- 8 Click **Save** and then **Publish** the dashboard so it becomes available to application users.
- 9 Preview the published dashboard to verify that all widgets display live data correctly.

#### Screenshots

The following are illustrative representations of the Dashboard Builder canvas and the published dashboard, showing the widgets configured as described above.

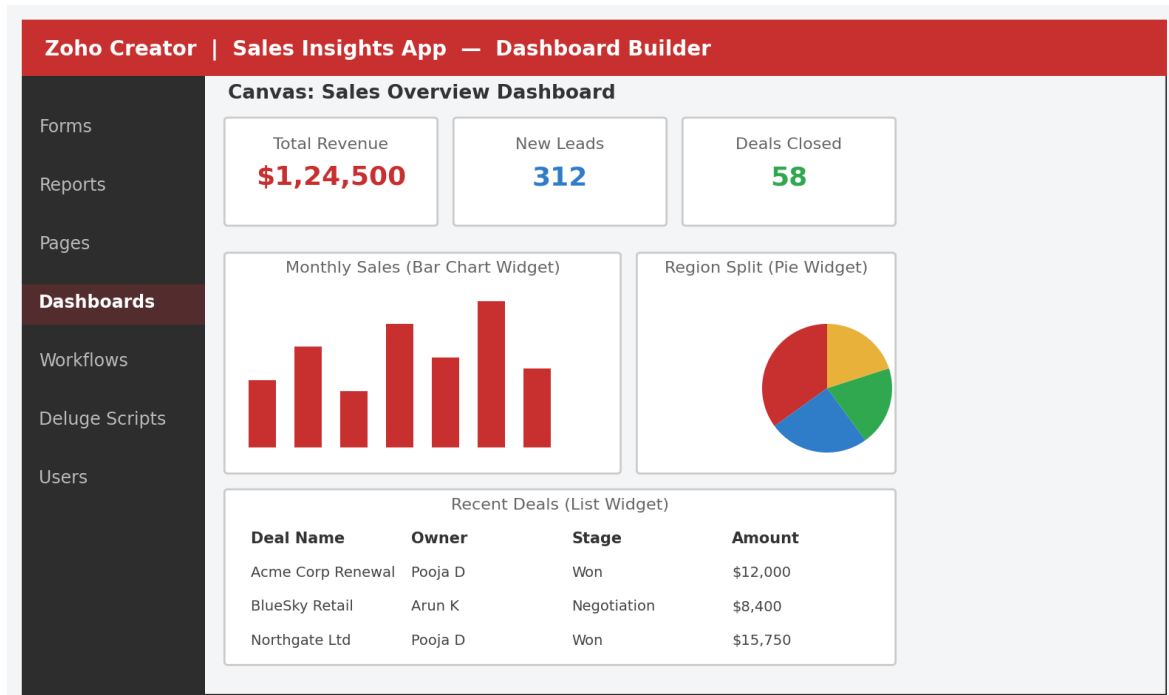

Fig 1: Dashboard Builder canvas in Zoho Creator with KPI cards, bar chart, pie chart and list widget.

#### Sales Insights App — Published Dashboard (Zoho Creator)

## Result

A Dashboard was successfully designed and published in Zoho Creator using low-code drag-and-drop widgets (KPI cards, bar chart, pie chart, and list view) to visualize key sales metrics, and the output was verified to display data correctly.
